

Cloud Journal Page

Take a look outside and record what kind of clouds you see:

Write your answers in sentences please! 😊
What kind of clouds do you think these are?

Describe the weather outside:

Make A Cloud

Try It Yourself!

Here's an experiment you can try yourself:

Things you will need

- ✓ warm water
- ✓ jar
- ✓ ice
- ✓ metal dish

Anything that cools air significantly will cause water vapor to condense. If the warm, moist air comes into contact with a cold surface it will chill the air. You can make water vapor to condense and form a cloud by chilling air.

What to do

Place ice in the metal dish. Let it stand until it is very cold.

Place 1 inch (2.5 cm) of warm water in the jar.

Place the metal dish over the top of the jar. What is happening inside the jar? A cloud will form near the top as the warm water evaporates, rises and condenses.

Give it a try!!
